APPLICANT: Kahan Leong
APPLICANT: Arthur B. Raitano
APPLICANT: Appulicant
APPLICANT: Douglas C. Saffran
APPLICANT: Douglas C. Saffran
APPLICANT: Steve Chappell Mitchell
TITLE OF INVENTION: NOVEL SERPENTINE TRANSMEMBRANE ANTIGENS
TITLE OF INVENTION: EXPRESSED IN HUMAN CANCERS AND USES THEREOF
FILE REFERENCE: 129.16USU2
CURRENT APPLICATION NUMBER: US/09/323,873A
CURRENT FILING DATE: 1999-06-01
PRIOR APPLICATION NUMBER: 60/087,520
PRIOR APPLICATION NUMBER: 60/087,520
PRIOR APPLICATION NUMBER: 60/091,183
PRIOR APPLICATION NUMBER: 60/091,183
PRIOR FILING DATE: 1998-06-30
Sequence 5278, Application US/09134001C

Patent No. 6380370

GENERAL INFORMATION:

APPLICANT: Lynn Doucette-Stamm et al

APPLICANT: Lynn Doucette-Stamm et al

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO STAPHYLOCOCCUS

TITLE OF INVENTION: EPIDERMIDIS FOR DIAGNOSTICS AND THERAPEUTICS

FILE REFERENCE: GTC-007

FILE REFERENCE: GTC-007

CURRENT APPLICATION NUMBER: US/09/134,001C

CURRENT FILING DATE: 1998-08-13

PRIOR APPLICATION NUMBER: US 60/064,964

PRIOR FILING DATE: 1997-11-08

This peptide was used to raise

C polyclonal anti-STRAP-1 N-terminus antibodies in sheep. The

CC antibodies were used to probe Western blots of cell lysates from

CC prostate and mon-prostate cancer cell lines, and in immunohistochemical

CC analysis of STRAP-1 expression. STRAP-1 is the prototype

CC exhibit a high degree of structural conservation, but which show

CC no significant structural homology to known human proteins. The STRAP-1

CC gene has been localised to chromosome 7922. STRAP-1 is thought to be a

CC type IIIa membrane protein and is expressed predominantly in prostate

CC cells in normal human tissues. Structurally, STRAP-1 is a 339 amino

CC acid protein characterised by six transmembrane domains and

CC intracellular N- and C-termini, suggesting that it folds in a

CC syrap-1 manar into three extracellular and two intracellular loops.

CC syrap-1 manar and protein expression is maintained at high levels and

CC syrap-1 mana and protein expression is maintained at high levels and

CC syrap-1 mana and protein expression is maintained at high levels and

CC syrap-1 mana and protein expression is maintained at high levels and

CC syrap-1 mana and protein expression is maintained at high levels and

CC syrap-1 mana and protein expression is maintained at high levels and

CC syrap-2 are cell-surface tumour antigens. Immunisation with a STRAP

CC specific binding agents, to produce antigens. Immunisation with a STRAP-1 and

CC syrap-2 are cell-surface tumour antigens. Immunisation with a STRAP

CC specific antibodies. The antibodies may be used for detection, prognosis,

CC and monitoring of cancers (or susceptibility to cancer), as therapeutic

CC modulation/inhibition of STRAP expression. Since high levels of STRAP

CC specific and prognostic reagents, for identifying STRAP-expressing

CC inhibitors of syrap expression. Since high levels of STRAP

CC specific and prognostic reagents for they are easil

comprises administering a vaccine composition to the patient. Treating a patient with a cancer that expresses STEAP, or inhibiting growth or killing cells expressing STEAP, comprises administering to the patient a vector encoding single chain monoclonal antibody that comprises the variable domains of the heavy and light chains of the monoclonal antibody that specifically binds to STEAP, and is sequence to the cancer cells and the encoded single chain monoclonal antibody coding sequence to the cancer cells and the encoded single chain monoclonal antibody is expressed intracellularly. The present sequence is an immunogenic peptide of STEAP-1. STEAP-1 gene is located on chromosome 7p22.3. This peptide is used to immunise sheep for the generation of sheep polyclonal antibodies towards the amino-terminus of anti-STEAP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; cytostatic; antiproliferative; vaccine; gene therapy; six transmembrane epithelial antigen of the prostate-1; STEAP-1; chromosome 7p22.3; cancer; prostate; colon; bladder; pancreatic; ovarian; lung; serpentine transmembrane antigen; immunogen.
                                                                                                                                                                                                                                                                                       The present invention relates to human six transmembrane epithelial antigen of the prostate (STEAP) protein. STEAP is a member of cell surface serpentine transmembrane antigens. STEAP gene is used in gene therapy. Inhibiting the development or progression of a cancer (eg. prostate, colon, bladder, lung, ovarian and pancreatic) expressing STEAP or inhibiting growth or killing cells expressing STEAP in a patient,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Homo sapiens.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation/differentiation activity, haematopoiesis regulating activity, tissue growth regulating activity, reproductive hormone regulating activity, chemotactic/ chemokinetic activity, haematory activity, receptor/ ligand activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  human secreted proteins, and encode the proteins given in AAY12261 AAY12514, respectively. The proteins given represent the signal per and an N-terminal fragment of a secreted protein. The nucleic acid

They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation/differentiation activity, haematopoiesis regulating activity, tissue growth regulating activity, reproductive hormone regulating activity, chemotactic/ chemokinetic activity, haematory activity, receptor/ ligand activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a cell.

This sequence represents a novel human protein, STRAP-1 (serpentine cransmembrane antigen of the prostate). STRAP-1 is the prototype caxhibit a high degree of structural conservation, but which show come has been localised to chromosome 7p2. STRAP-1 is thought to be a cype life and protein and is expressed predominantly in prostate call protein characterised by six transmembrane domains and cointracellular N- and C-termini, suggesting that it folds in a cyperested in cartain other cancer. STRAP-1 hat high levels and chromosome 7p2. STRAP-1 is a 39 amino capture manner into three extracellular and two intracellular loops. STRAP-1 mRNA and crotein expression is maintained at high levels and chromosome strapes of prostate cancer. STRAP-1 mRNA and/or protein is grap-junction protein cancer. The function of the STRAP protein is not known. They may be ion channels (from the presence of six transmembrane domains, a feature which is shared by certain ion channels) or grap-junction proteins (from immunorial immunor ersponses against STRAP-1 and STRAP-2 are cellular and humoral immunor responses against content induces cellular and humoral immunor responses against specific-binding agents, to produce anticancer vaccines and to generate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  and monitoring of cancers (or susceptibility to cancer), as therapeutic inhibitors or to target therapeutic agents to their site of action. STRP nucleic acids may be used for recombinant protein production, as diagnostic and prognostic reagents, for identifying STRAP-expressing cells for screening inhibitors of STRAP expression and for therapeutic modulation/inhibition of STRAP expression. Since high levels of STRAP proteins are exposed on the CTRAP expression, they are easily targetted by systemically administered agents, and because they are expressed mainly on prostatic epithelial cells, agents targetted to them should have minimal side effects on other tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             30-JAN-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence

```

The invention relates to isolated prostate-specific polynucleotides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (or antigenic epitopes derived from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence

the presence of

549;

579pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cancer, especially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer especially prostate cancer. Compositions comprising the polynucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for detecting cancer. The present sequence is a prostate specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Tang

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; cytokine; cell proliferation; cell differentiation; gene th vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia;
The invention relates to polymucleotides (AAKS1456-AAKS3435) and the encoded polypeptides (AAM78322-AAM60302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymucleotides and polypeptides are useful in gene therapy. Vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating
                                                                                                                                                                                                                 Claim
                                                                                                                                                                                                                                                               Nucleic acids encoding polypeptides with cytokine-like activities, useful in diagnosis and gene therapy -

cc and can be used in vaccine production and (II) have cytostatic activity,

cc antibodies to (II), fusion proteins comprising (II), and isolated

cc rells prepared using (I) or (II) are used treat cancer in a patient.

cc (I) and the antibodies are also used in the detection of cancer in a

cc patient. The cancer that is diagnosed or treated is particularly

cc prostate cancer. (I) and (II) can be used in vaccines. The antibodies or

cc (I) and (II) can also be used to rested is particularly

cc methods for prostate cancer. They can indicate the level of metastasis

as well as the prostate volume. AAH93357 to AAH01318 represent polymuclectide and anino acid sequences used in the

cc exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     និនិនិនិនិនិន្តិនិ

                               The present invention relates to methods of detecting a prostate cancer-associated transcript in a cell from a patient. The method comprises contacting a biological sample from the patient with prostate cancer-associated polynucleotides (designated PC genes) that selectively hybridise to a sequence that is at least 80% identical to them. The prostate cancer-associated polynucleotide sequences are differentially expressed in prostate tumour tissue or in prostate cancer and are derived from the tissues of various organisms such as humans or other mammals (e.g. mice, sheep and dogs). The methods of the invention are useful for diagnosing and treating prostate cancer as well as for identifying modulators of prostate cancer as gents that inhibit prostate cancer. The nucleic acid sequences are particularly useful in gene therapy, as a vaccine or in antisense applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides prostate-specific coding sequences and their encoded proteins. These can be used in the diagnosis and treatme of cancers, particularly prostate cancer. The present sequence is a protein described in the invention.
                                                                                                                                                                                                                                                     Tang

The polypucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; cytostatic; antiproliferative; vaccine; gene therapy; six transmembrane epithelial antigen of the prostate-1; STEAP-1; chromosome 7p22.3; cancer; prostate; colon; bladder; lung; ovarian;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is human six transmembrane epithelial antigen of CC the prostate (STEAP)-1 protein of clone 10. STEAP is a member of cell CC surface serpentine transmembrane antigens. STEAP-1 gene is located on CC chromosome 792-3 and is used in gene therapy. Inhibiting the development CC or progression of a cancer (eg. prostate, colon, bladder, lung, ovarian CC and pancreatic) expressing STEAP or inhibiting growth or killing cells CC expressing STEAP in a patient. Treating a patient with a cancer that CC composition to the patient. Treating a patient with a cancer that CC expresses STEAP, or inhibiting growth or killing cells expressing STEAP, CC comprises administering to the patient a vector encoding single chain CC comprises administering to the patient a vector encoding single chain CC comprises administering to the patient a vector encoding single chain CC comprises that the vector delivers the variable domains of the heavy and CC such that the vector delivers the single chain monoclonal antibody coding CC sequence to the cancer cells and the encoded single chain monoclonal CC antibody is expressed intracellularly.

CC Note: The present sequence is also shown in sequence listing of the specification, but it lacks amino acid residues at its N-terminal end.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cc human secreted proteins expressed in prostate, and encode the proteins cg jven in AAY11716 to AAY1193 respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene cc products. They can also be used to develop products for diagnosis and ctherapy. The proteins obtained may have cyrokine activity, cell composite and ctivity, tissue growth regulating activity, reproductive hormone cregulating activity, chemotactic/chemotinetic activity, haemostatic and chromobolytic activity, receptor/ligand activity, anti-inflammatory can be used in forensic, gene therapy and chromosome mapping proceduces. The sequences can also be used for obtaining corresponding promoter concerning extracellular secretion of a polypeptide or the insertion of a polypeptide into a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC by expressing KIM encoding polynuclearities to promote growth and/or converses to proteins. College the KIM proteins are upregulated in injured or regenerating (especially renal) tissues. CC KIM fusion proteins, conjugates, antibodies and vectors can also be used therapeutically, e.g. these or the KIM proteins may be included with an caceptable carrier in pharmaceutical compositions, useful for therapy/ CC prophylaxis of conditions associated with disfunction/disregulation of KIM genes or proteins, especially renal diseases or impairments of renal cfunction in humans (e.g. acute renal failure, acute nephritis). The polynucleotides can be used to produce antisense sequences which, when cinternalised into cells, can disrupt expression of a cellular KIM gene, also useful in therapy (e.g. to block the growth of tumours dependent on KIM for growth) or compositions. The proteins and polynucleotides are cuseful diagnostically e.g. to detect and quantify renal injury/disease (indicative of increased risk, or presence of, renal injury (indicative of increased risk, or presence of, renal injury (indicative of increased risk, or presence of, an autoinmune response or abnormal conting cells (especially specific loci, calso be used to locate KIM-producing cells (especially specific loci, carising from/affecting renal tissue), by contacting cells with an accumulation.

CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC polymelectides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC for identifying expressed genes. (I) is useful in gene therapy techniques CC (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical company of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity amino acid sequences of data and products dependent on DNA and CC amino acid sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed case for the patent of the printed control of the control of the control of the printed control of the control of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity
